WEB DEVELOPMENT
ACTIVITY-BASED PROGRAM REPORT

HTML and CSS Website Design Projects

Name	Maremalla Manasa
Roll Number	26000038
Section	1
Branch	CSE

Submitted as a record of three website development activities demonstrating page structure, styling, content organization, and user-interface design.

Academic Activity Report • 2026

Introduction

Web development combines structure, presentation, and usability to create useful websites. HTML (HyperText Markup Language) organizes page content, while CSS (Cascading Style Sheets) controls visual presentation such as colors, spacing, typography, grids, and responsive layouts. This report documents three practical website projects built around common real-world needs.

Objectives

- Apply HTML elements to organize headings, navigation, sections, cards, forms, lists, tables, and images.
- Use CSS to improve readability, layout, color contrast, spacing, and visual consistency.
- Present each website's purpose, case study, input/content, output, and key features.
- Review the rendered browser output and relate it to the design requirements.

Projects Included

Project	Purpose	Main components
1. Travel Agency Website	Help visitors explore destinations and holiday packages.	Hero banner, destination cards, packages, inquiry form
2. Online News Portal	Present news by category in a clear, scan-friendly layout.	Top story, category navigation, article cards, author details
3. Community Service Project Website	Document a community project, activities, progress, and outcomes.	Objectives, activities, photos, reports, volunteer table, timeline

Note: The screenshots are grouped by project according to the website shown in each image. The forms and content shown are demonstration interfaces; they do not imply a live database or backend submission system.

Project 1: Travel Agency Website

Case Study

A travel agency needs a simple website where visitors can discover destinations, compare holiday packages, and send a travel inquiry. The page uses a prominent hero section to attract attention and organizes information into destination and package cards.

Input and Output

Input: Visitor-provided details in the Travel Inquiry form: name, email, selected destination, travel date, number of travelers, and special requirements. The visitor can also use the navigation links and the “Explore Now” call-to-action.

Output: A travel landing page with a mountain hero image, “Explore The World!” heading, popular destination cards (Agra, Manali, and Dubai), holiday package details, an inquiry form, and a footer.

Important Features

- Navigation links for Home, Destinations, Packages, and Contact
- Hero banner with a call-to-action button
- Destination cards with images and short descriptions
- Holiday packages with duration, price, and day-wise itinerary
- Travel inquiry form with text fields, a destination selector, date input, traveler count, and requirements box

HTML Used (Purpose, Not Source Code)

Semantic headings and sections; navigation links; image elements; destination/package card containers; form, input, select, textarea, and button elements; footer text.

CSS Used (Purpose, Not Source Code)

Dark teal navigation and footer; full-width hero background with readable text overlay; centered content; card layout; rounded corners and soft shadows; consistent spacing and typography; pale section backgrounds.

Explanation

The HTML defines the content hierarchy and interactive interface elements, while CSS controls how those elements appear in the browser. Together, they make the project easier to navigate, visually organized, and suitable for presenting the intended information. The screenshots on the following pages show the rendered output.

Project 2: Online News Portal

Case Study

A news portal must help readers quickly identify important stories and browse categories without reading an unstructured page. The layout places a featured story first, followed by category-based cards for national, international, sports, technology, and business news.

Input and Output

Input: The primary input is the reader's selection of a category from the navigation bar. The content itself consists of sample headlines, article descriptions, author names, dates, and topic images. No search or article-submission control is shown in the supplied screenshots.

Output: A “Daily News” page with a title and subtitle, red category navigation, a featured “Today's Top Story” section, and article cards with images, descriptions, and author details.

Important Features

• Category navigation for five news sections
• Featured story area with a large image
• Separate cards for National, International, Sports, Technology, and Business
• Author bylines and a featured-story date
• Multicolumn card layout with consistent image sizing and spacing

HTML Used (Purpose, Not Source Code)

Header and navigation elements; heading and paragraph tags; section containers; image elements; article/card blocks; author and date text; footer.

CSS Used (Purpose, Not Source Code)

Navy header and footer with a red navigation bar; light neutral page background; white cards; rounded corners and shadows; image sizing; bold red category headings; grid-based multicolumn layout.

Explanation

The HTML defines the content hierarchy and interactive interface elements, while CSS controls how those elements appear in the browser. Together, they make the project easier to navigate, visually organized, and suitable for presenting the intended information. The screenshots on the following pages show the rendered output.

Project 3: Community Service Project Website

Case Study

A community service team needs a website to explain its purpose, list planned activities, record weekly progress, identify volunteer responsibilities, and summarize outcomes. The page acts as a project documentation and presentation portal.

Input and Output

Input: The content inputs are the project's objectives, activity descriptions, actual project photographs, weekly reports, volunteer names and roles, timeline stages, and measured outcomes. The screenshots contain sample text and explicitly indicate that actual photographs/results should replace placeholders where appropriate.

Output: A green-themed “Community Service Project” website with a navigation bar, welcome section, objectives list, activity cards, project photographs, weekly reports, volunteer details table, timeline, outcomes, and footer.

Important Features

- Navigation links to Home, Objectives, Activities, Reports, Volunteers, Timeline, and Outcomes
- Project introduction and objectives list
- Three activity cards: Cleanliness Drive, Tree Plantation, and Education Awareness
- Photograph gallery
- Weekly reports and a volunteer details table
- Numbered project timeline and outcomes section

HTML Used (Purpose, Not Source Code)

Header and navigation; heading and paragraph tags; unordered and ordered lists; activity-card containers; image elements; table, table rows, and cells; footer.

CSS Used (Purpose, Not Source Code)

Green header and footer; light green page background; white content panels with rounded corners and shadows; three-column activity and photo layouts; styled table header; consistent typography and spacing.

Explanation

The HTML defines the content hierarchy and interactive interface elements, while CSS controls how those elements appear in the browser. Together, they make the project easier to navigate, visually organized, and suitable for presenting the intended information. The screenshots on the following pages show the rendered output.

Project 3: Community Service Project Website — Output Screenshots

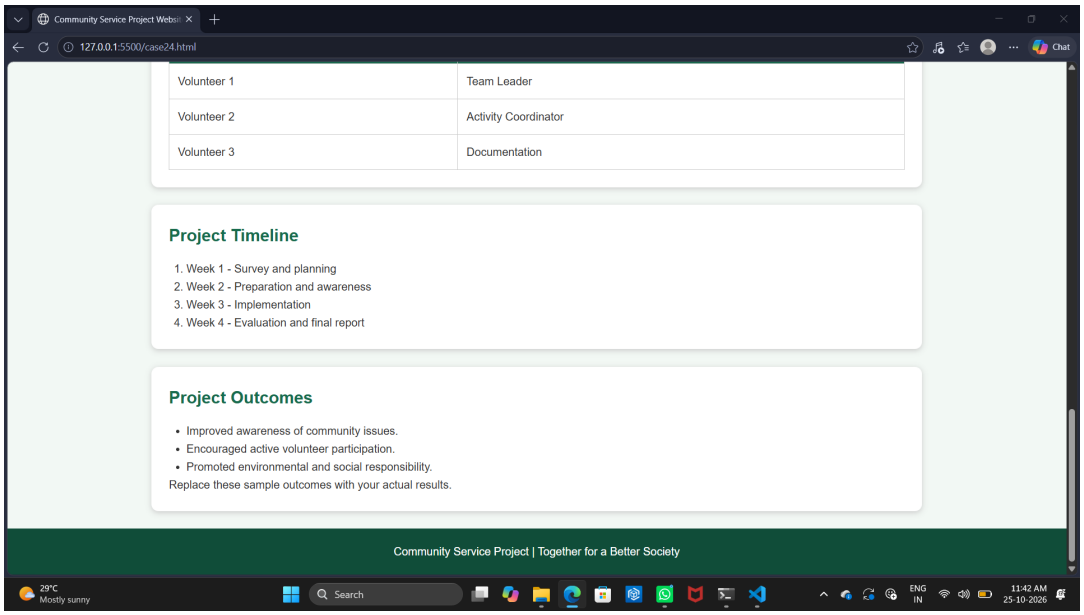

Figure 3.4: Browser output — screenshot 24

Conclusion

The three projects demonstrate how HTML and CSS can be used to build different kinds of information websites. The Travel Agency Website focuses on destination discovery and travel inquiries; the Online News Portal organizes stories by category; and the Community Service Project Website documents activities, people, progress, and outcomes. Across the projects, headings, navigation, cards, images, forms, lists, and tables help structure content, while CSS improves readability and presentation.

Learning Outcomes

• Practised organizing web content using common HTML elements.
• Understood how CSS colors, spacing, typography, cards, and grids shape page layout.
• Learned to present a case study with input/content, output, features, and a short explanation.
• Recognized that forms and navigation shown in a static front-end demo may need JavaScript or server-side code to process real submissions.
